SUBJECT: California Environmental Quality Act: environmental leadership
development projects: data centers: geothermal powerplant projects

SOURCE: Author

DIGEST: This bill provides that the California Environmental Quality Act (CEQA) applies to data center projects, as defined. This bill adds data center projects meeting specified conditions and geothermal projects, to existing judicial streamlining provisions for Environmental Leadership Development Projects (ELDPs).

Assembly Amendments make changes to the definition of ‘data center’, and strike the requirement for data center operators to comply with regular reporting requirements to be eligible for ELDP, among other changes.

ANALYSIS:

Existing law:

- 1) Establishes CEQA, which requires lead agencies with the principal responsibility for carrying out or approving a project to prepare a negative declaration (ND), mitigated negative declaration (MND), or environmental impact report (EIR) for the project, unless the project is exempt from CEQA. (Public Resources Code (PRC) §21000 et seq.). If a project may have a significant effect on the environment, the lead agency must prepare a draft EIR. (CEQA Guidelines §15064(a)(1), (f)(1))
- 2) Defines "ministerial" projects to mean a governmental decision involving little or no personal judgment by the public official as to the wisdom or manner of carrying out the project, involving only the use of fixed standards or objective measurements. A building permit is ministerial if the ordinance requiring the permit limits the public official to determining whether the zoning allows the structure to be built in the requested location, the structure would meet the strength requirements in the Uniform Building Code, and the applicant has paid the fee. (CEQA Guidelines §15369)
- 3) Establishes over 135 CEQA exemptions in the public resources code, water code, government code and other statutes, and includes 33 categorical CEQA exemptions in the California Code of Regulations. (CEQA guidelines §15260-15285)
 - a) Specifies that ministerial projects are not subject to CEQA.
- 4) Established the Jobs and Economic Improvement Through Environmental Leadership Act of 2011 (AB 900, Buchanan, Chapter 354, Statutes of 2011),

which established accelerated CEQA administrative and judicial review procedures for an "environmental leadership" project. The Act was later extended and modified in 2021 to include infrastructure projects for clean energy, transportation, and water (SB 7, Atkins, Chapter 19, Statutes of 2021). (PRC §21178 et seq.)

This bill:

- 1) Defines "data center" as a facility, or part of a facility, that houses computing infrastructure, including graphics and central processing units, servers, storage devices, networking equipment, and associated power and cooling systems, for the primary purpose of processing, storing, or distributing electronic data.
- 2) Requires, notwithstanding any other law, that CEQA applies to the issuance of entitlements related to the development and operation of a data center.
- 3) Prohibits a categorical exemption for a project proposed to be carried out or approved by a public agency in furtherance of the development and operation of a data center.
- 4) Provides that a data center project is an ELDP if it is certified by the lead agency to meet all the following conditions:
 - a) The applicant pays the full cost of interconnection to prevent cost shifts to other ratepayers.
 - b) Does not increase fossil fuel consumption within the state.
 - c) Includes zero-carbon energy storage with at least four hours of capacity at 100% of forecasted peak demand for the facility.
 - d) Uses onsite zero-carbon energy storage to provide demand response services to the electrical grid.
 - e) Relies on zero-carbon generation located behind the meter to the maximum extent feasible.
 - f) The applicant commits to fully pay all electrical grid investments, including costs of new generating capacity, to serve the data center.
 - g) Uses recycled water and water-efficient technology or waterless cooling systems.

- h) Will rely on 100% zero-carbon electricity resources to serve hourly energy needs within five years of initial operations, of which 75% shall be newly developed.
 - i) Will meet specified requirements regarding avoidance and mitigation of impacts in a disadvantaged community.
 - j) Enters into one or more legally binding and enforceable community benefits agreement with community-based organizations.
 - k) Meets specified requirements regarding construction labor per AB 205 (Budget Committee), Chapter 61, Statutes of 2022.
- 5) Requires the Office of Land Use and Climate Innovation (LCI), in consultation with the California Energy Commission (CEC) and other state agencies, to develop uniform statewide standards for these conditions, as part of the CEQA Guidelines.
- 6) Provides that a geothermal powerplant is an ELDP if it is certified by the lead agency to meet both of the following conditions:
- a) Meets the criteria for an eligible renewable energy resource, excluding resources that combust biomass fuels.
 - b) Meets specified requirements regarding construction labor per AB 205.
- 7) Makes related findings.

Background

A, B, C's of CEQA. CEQA is an environmental planning law designed to (a) make government agencies and the public aware of the environmental impacts of a proposed project, (b) ensure the public can take part in the review process, and (c) identify and implement measures to mitigate or eliminate any negative impact the project may have on the environment. CEQA is enforced by civil lawsuits that can challenge any project's environmental review, and it is the only state environmental law that allows civil suits. Under CEQA, projects (unless they have a specific exemption) must undergo environmental analysis.

Environmental Leadership Development Programs. While only a small number of projects are challenged under CEQA (e.g. 1.05% of projects that went through

CEQA in 2022-2023 were challenged¹), very environmentally impactful and controversial projects are more likely to face a lawsuit. The Legislature has developed streamlining measures to speed CEQA lawsuits against specified, often large-scale and high-profile, projects through the courts.

In current law, this CEQA streamlining entails both judicial and administrative streamlining. Judicial streamlining requires that a CEQA lawsuit be heard in 270 days, including all appeals, as feasible. Administrative streamlining requires projects to prepare the administrative record, the comprehensive document at the heart of a CEQA case, at the same time as the environmental review documents are prepared. Preparing these documents concurrently, instead of sequentially, saves time if there is a lawsuit. These streamlining measures shorten what is potentially the lengthiest portion of the CEQA process—litigation—while retaining the full environmental review and public engagement offered under CEQA.

Environmental impacts of data centers. Data centers house the equipment used to process, store, and transmit digital information. Data centers have experienced explosive growth in recent years primarily in response to the AI boom. In early 2014, U.S. data center construction ran at an annualized rate of roughly \$1.6 billion. By July 2025, that number reached about \$41.0 billion, more than 25 times the 2014 level. According to Statista, an online statistics and market data platform that collates market data, the global Data Center market is projected to reach US \$527.46 billion in 2025, with revenue growing to US \$739.05 billion by 2030, and the United States contributing the largest share at US \$171.90 billion. Explosive growth in data centers has significant implications for the environment, as data centers consume huge amounts of energy and water resources, which can result in environmental impacts.

Energy use: According to a U.S. Department of Energy publication² produced by Lawrence Berkeley National Laboratory, data centers consumed about 4.4% of total U.S. electricity in 2023. Data centers are expected to consume approximately 6.7 to 12% of total U.S. electricity by 2028. Data centers that serve AI customers are particularly large electricity consumers within the data center sector. Five of the anticipated facilities serving OpenAI could collectively use more electricity than 3 million households.³

³ <https://www.nytimes.com/interactive/2025/03/16/technology/ai-data-centers.html>

Depending on the source of all that energy, data centers could have an impact on air pollution and greenhouse gas emissions. Data centers can also lead to localized air pollution from backup power sources at the facilities. One study examining local air pollution from data centers in Texas found that generator testing alone can emit around 12 metric tons of NO_x annually per large data center⁴.

Water use: Data centers consume water directly, using it for cooling, and also use water indirectly as part of their energy generation. It is not entirely clear how much water consumption happens on site since estimates vary by facility type and size; however, the on site consumption estimates range from about 18,000 gallons per day for smaller wholesale and retail data centers to approximately 300,000 gallons per day for a mid-sized data center, and around 550,000 gallons per day for a hyperscale data center.⁵

Water use by data centers can strain local and regional water supplies and adversely impact ecosystems. One study estimated that about one-fifth of U.S. data centers used water from water-stressed watersheds in 2021.⁶ A Bloomberg study estimated that two-thirds of the data centers built since 2022 are located in areas of high water stress.⁷

Researchers at UC Riverside estimate that statewide on-site data center water consumption in California will balloon from 351 million gallons in 2019 to between 1.12 and 1.75 billion gallons by 2028.⁸

Comments

- 1) *Purpose of Bill.* According to the author, “Data centers are getting built at an extreme rate without adequate guardrails, creating air quality, water supply, and energy supply challenges for local communities across the country. Imperial county, which has one of the highest unemployment rates in the state, is currently evaluating multiple proposed hyperscale projects that could transform the region. This could bring substantial economic development to the region, but if done incorrectly, could offset the benefits and have disastrous impacts on public health and energy costs. This measure incentivizes good

neighbor data center development for projects that support California's grid and the communities in which they are built.”

- 2) *Data centers permitting in the balance.* California has the third most data centers of any state in the country, (after Texas and Virginia). As more data centers are planned in California, it is important to consider the benefits and risks of continued data center growth for Californians. SB 887 strikes a balance by requiring that data centers undergo the environmental planning and transparency of CEQA, while at the same time offering shortened litigation timelines (and certainty to data center developers that their projects will not get tied up in lengthy lawsuits).

This approach ensures that important environmental review is being retained, while also providing benefits (and thus promoting) data centers that have environmental and labor protections that developers might otherwise not consider.

- 3) *Ministerial grading: data center workaround?* The legality of a ministerial (meaning non-discretionary and thus not a project subject to CEQA) approval of a data center is currently under review in the courts: the City of Imperial, California, is suing Imperial County, alleging the improper application of a ministerial approval for a grading project that would lead to a large data center.

According to local news source summary of the case⁹: “...in early September, Imperial County determined that a large (950,000-square-foot, or roughly six times the size of an average Costco¹⁰) data center project, located on industrially zoned land, was permitted ministerially under the county's zoning code. In early November, the county approved a ministerial grading permit and issued a notice determining the project was exempt from CEQA.”

(In its notice of exemption, the county states that “the ministerial process applies only to grading activity, not the entire data center project.”)

In early December, the city of Imperial filed a lawsuit against the county and the project developer, asserting that the project required a rezoning and a conditional use permit (CUP), and therefore could not qualify for a CEQA exemption.

⁹ https://www.thedesertreview.com/news/city-of-imperial-s-data-center-lawsuit-hits-setback-as-court-rejects-amended-complaint/article_4cf8bf2f-5b51-42d9-9dd4-12cda6d6f71e.html

¹⁰ <https://www.sfgate.com/california/article/california-data-centers-21331191.php>

“After reviewing the county’s zoning code, the county and the developer notified the city of their intent to file a motion for judgment on the pleadings (in effect, to dismiss the complaint), on the grounds that neither a rezoning nor a CUP was required. The city agreed to amend its complaint, per the release, but the court found (on Feb 10th) that the amended complaint was legally insufficient, effectively concluding that the project does not require a rezoning or a CUP... The court granted the city leave to amend one final time.”

This situation has brought into question whether or not data centers could, under any conditions, be considered ministerial and thus exempt from CEQA. To address this concern SB-887 specifies that data centers are required to be subject to CEQA.

- 4) *Data centers to the front.* Requiring data centers to meet high environmental and labor criteria to get a priority pass through the courts in the case of a lawsuit offers an incentive to data centers to ‘do the right thing’ and meet the high environmental and labor standards set in the program. However, allowing data centers to be eligible for CEQA streamlining means that they are competing for yet another finite resource: court capacity.

Currently, ELDP projects, while expedited, are not moved through the courts (including all appeals) in 270 days. Requiring that data centers be given priority for expedited, 270-day (as feasible) judicial review means that some other ELDP project, including major clean energy, water, or transportation projects, will move slower through the queue.

When the Legislature made clean energy, water, and transportation projects eligible for CEQA judicial streamlining, it also appropriated one million dollars to the judicial council for judicial officer training for implementation of the above provisions.

FISCAL EFFECT: Appropriation: No Fiscal Com.: Yes Local: Yes

- 1) CEC estimates ongoing annual costs of approximately \$1.8 million for eight positions to develop the required statewide standards, develop reporting requirements for ongoing compliance, and conduct enforcement and seek administrative civil penalties.

- 2) The Governor’s Office of Land Use and Climate Innovation (LCI) estimates General Fund costs of about \$513,000 annually for two years for two limited-term

air pollution specialists to facilitate the inclusion of data centers into the ELDP judicial streamlining program.

3) By establishing criteria by which a data center project may qualify for CEQA streamlining as an ELDP, this bill creates potential cost pressures (Trial Court Trust Fund, General Fund) of an unknown amount to the courts to process and hear CEQA challenges to eligible data center ELDPs on an expedited timeline. The state budget provides annual General Fund backfills to the Trial Court Trust Fund to offset revenue reductions, totaling approximately \$117.3 million in 2025-26.
